PROBLEM STATEMENT

Every conference requires a tailored registration system to manage various types of attendee information, including text inputs and selection options, along with their interdependencies. Currently, this leads to repeated efforts and significant resource use, as organizers must build unique systems for each event. . Our goal is to create a no-code GUI platform that makes this task easier, reducing redundancy and operational complexity.

PROPOSED SOLUTION

Develop a versatile conference registration management system that:

- 01 Allows organizers to create customized forms.
- 02 Supports three essential input types: Text, Single Select, and Multi Select
- 03 Enables logical dependencies between various fields
- 04 Exportable HTML

- Home
 - Form 1
 - Form 2
 - Grandchild two
 - Great grandkid 1
 - Great grandkid 2
 - Great grandkid 3
 - Grand Child three

TECHNOLOGY STACK

Our platform is built exclusively using HTML, CSS, and JavaScript. This combination of technologies was selected to ensure maximum compatibility, flexibility, and ease of use..

As the backbone of all web pages, HTML provides the structure of our forms, ensuring that they are accessible on any web-enabled device

CSS allows us to create visually engaging and responsive designs, adding an aesthetic element to the form

JavaScript

Adds interactive elements to our web forms, enabling the dynamic functionalities such as real-time form adjustments, logical dependencies

TECHNOLOGY STACK

Below are the key reasons and advantages for selecting our specific technology stack:

Cross-Platform Compatibility

The use of standard web technologies ensures that our system works seamlessly across all platforms and devices

Ease of Development and Maintenance

Using a widely understood and documented stack like HTML, CSS, and JavaScript speeds up development and simplifies future upgrades or customization.

Scalability

These technologies allow us to easily scale the solution to accommodate more features and handle a higher volume of users without significant changes to the architecture

KEY FEATURES

Diverse Input Types

Incorporate text boxes, single-select, and multi-select options to capture a wide range of attendee information.

Logical Dependencies

Easily set up rules that trigger additional questions or options based on previous attendee responses

KEY FEATURES

Static Text Embedding

Enable users to insert descriptive text elements such as conference names, headings, or instructions directly into the form

Interactive Editing

Double-click any form element to enter edit mode, enabling addition, deletion, or modification of options and linking of questions to establish dependencies

A background image showing a modern office environment. In the foreground, a man in a light blue shirt is partially visible on the left, and a woman with curly hair is on the right. In the background, two women are looking at a laptop. The office has large windows and a mezzanine level with chairs.

KEY FEATURES

Dynamic Form Sizing

Dynamically adjust the size of the form with a simple button press, accommodating more content or detailed inputs as needed

HTML Export

Instantly generate and download the HTML code of your customized form for easy integration into websites or other platforms

QUALITY ATTRIBUTES

Flexible Layout

Empower users to arrange and style form elements with precision, enhancing the aesthetic appeal of the registration interface

No-Code Design

Utilize a user-friendly drag-and-drop interface to create and customize registration forms effortlessly.

LEARNINGS

TEAM COLLABORATION

Keeping everyone informed and supportive helped us use our different skills better and made the project more successful

TIME MANAGEMENT

Effective time management proved essential in this project. By establishing clear milestones and prioritizing tasks, we were able to optimize workflows, avoid bottlenecks, and ensure timely delivery within the set deadlines
